3. The claims have been amended as follows:

4. In **claim 1**, the claim has been amended as follows:

A processor-implemented method comprising:
receiving, at the processor, network configuration information and traffic demand information for a network;
generating, by the processor, a plurality of ring cover candidates, each ring cover candidate including a plurality of rings, based on the network configuration information and the traffic demand information, each of the rings including a plurality of network spans, where the generating the ring cover candidate includes generating the plurality of ring cover candidates by using a different process to generate each of the ring cover candidates, wherein the plurality of ring cover candidates vary in cost;

counting, for each ring cover candidate of the plurality of ring cover candidates, a number of loaded network spans covered by the ring cover candidate; and

selecting one of the plurality of ring cover candidates as a recommended ring cover candidate by selecting the one of the ring cover candidates having a highest number of loaded network spans.

5. In **claim 16**, the claim has been amended as follows:

An apparatus comprising: at least one storage device to store instructions; and at least one processor to execute the instructions to:

generate a plurality of ring cover candidates based on configuration information and traffic demand information associated with a network, where the at least one processor generates the plurality of ring cover candidates using a different set of parameters to generate each of the ring cover candidates, wherein the plurality of ring cover candidates vary in cost;

count, for each ring cover candidate of the plurality of ring cover candidates, a number of loaded network spans covered by the ring cover candidate, and

select one of the plurality of ring cover candidates as a recommended ring cover candidate by selecting the one of the ring cover candidates having a highest number of loaded network spans.

6. In **claim 23**, the claim has been amended as follows:

Art Unit: 2477

A system comprising:

means for receiving network configuration information and information representing predicted traffic demand for a network;

means for generating a plurality of ring cover candidates using a different process to generate each of the ring cover candidates, based on the network configuration information and the information representing predicted traffic demand, each of the ring cover candidates including a plurality of rings, and each of the rings including a plurality of network spans, wherein the plurality of ring cover candidates vary in cost;

means for counting, for each ring cover candidate of the plurality of ring cover candidates, a number of loaded network spans covered by the ring cover candidate; and

means for selecting one of the ring cover candidates as a recommended ring cover candidate, the recommended ring cover candidate having a highest number of loaded network spans.

7. In **claim 24**, the claim has been amended as follows:

A hardware memory device having recorded thereon instructions for at least one processor, the instructions comprising instructions for the at least one processor to perform a method, the method comprising:

generating a plurality of ring cover candidates for a network by using a different procedure to select a respective plurality of rings for each of the ring cover candidates, the generation of the ring cover candidates being based on

Art Unit: 2477

configuration information and information representing predicted traffic demand associated with the network, each of the rings including a plurality of network spans, wherein the plurality of ring cover candidates vary in cost;

counting, for each ring cover candidate of the plurality of ring cover candidates, a number of loaded network spans covered by the ring cover candidate; and

selecting one of the ring cover candidates as a recommended ring cover candidate, the recommended ring cover candidate having a highest number of loaded network spans.
